H3 Prompt Composer V5.36.1

Illustrated User Guide

Choose the right mode

Route references by job

Build Shots from visible action

Check the prompt before generation

Visual quick start and feature tour

August 21, 2026

Standalone HTML - local browser app - no installation

The workspace at a glance

Left: project setup and reference library. Center: Generations and Shots. Right: generated prompt, Check, Suggestions, and Phrases.

- Start in the left column.
- Build the active Generation in the center.
- Finish in the right column before copying the prompt.

1. Choose the workflow

If you have...	Choose
Only text	T2VA
A required first frame	I2VA
Required first and last frames	FL2VA
A required final frame	L2VA
Character, Environment, Video, or Audio references	Ref2VA
A single-image edit or composite	Image
Video grammar T2VA/I2VA/FL2VA/L2VA use integrated_multimodal_description, overall_soundscape, and non_diegetic_music. Ref2VA uses six sections. Image mode is separate.	

2. Map the connected inputs

Guided Reference Setup images · video · audio Close

Plan the physical Picture, Video, and Audio inputs connected to H3. You may own many more files than the model can receive at once; this wizard defines what each connected input is reserved for. Your work stays open until you explicitly choose Close, Cancel, or Create reference setup.

1 How many model inputs are you using?
Count connected inputs, not every file in your project. H3 accepts up to nine Picture inputs.

☒ **I will use Picture inputs**
How many Picture inputs are connected?
4

☒ **I will use Video inputs**
How many Video inputs are connected?
1

☒ **I will use Audio inputs**
How many Audio inputs are connected?
1

2 What is each input reserved for?
Assign characters, environment banks, scale, continuity, composition, wardrobe, lighting, performance, or audio roles. Shot routing happens later while you build the Generation.

PICTURE INPUTS

Picture input 1 Fixed model input

Reserve this input for: **Subject / character identity** ▼

Subject name: **Character 1**
Use the same name on another Picture Input only when both images show the same Subject.

What kind of Subject is this? **Character / person** ▼

Describe Character 1
Describe permanent identity and the current temporary look separately. The optional first-shot control is only a visibility instruction.
Stable identity — what should never change

Cancel Create reference setup

Guided Reference Setup asks what is physically connected, then reserves each input for a clear job.

- Count sockets, not files in your archive.
- Pin stable character inputs when useful.
- Reuse remaining Picture numbers among inactive Environment alternatives.
- Verify the Current Generation input map against ComfyUI.

3. Build a Generation, then build its Shots

Shot stage	Question to answer
Scene and subjects	What world and visible cast are present?
Opening State	Where is everything at frame zero?
Action	What physically changes over time?
Camera	What is framed, from where, and how does the camera move?
Dialogue	Who speaks, how, and what exact words are heard?
Sound	What synchronized physical sounds occur?

Cuts versus Beats

Use a new Shot for a real cut to new information. Use Timed Action Beats when the camera remains continuous and only action pacing changes.

4. Plan camera motion visually

Drag grid to rotate · mouse wheel to zoom · drag the lower-right edge to reset · Top Front Reset 1/4 100% Fit Full screen

Green arrow = shot front. The grid keeps one orientation for the whole shot: left is frame-left, right is frame-right, and the green arrow points toward the front of the shot. Each dashed stalk runs from the camera to its floor position so elevation stays visible.

1 · 0.0s 2 · 8s

Camera subject
Main subject described in this Shot Use the Scene, Opening, and Action fields to identify the subject naturally.

Path shape Arc direction
Arc around subject Clockwise from above

Overall pace Speed change
Slow Automatic

When the subject moves
Camera follows the subject **How left and right work**
The camera move stays attached to the subject. Left and right remain frame-left and frame-right for the whole shot.

Movement feel Framing
Smooth / controlled Medium-wide / three-quarter

Subject motion comes from Action & Timed Beats.
A ceramic artist sits at a wooden wheel in a sunlit studio with both hands resting on the centered lump of wet clay. She presses both thumbs into the spinning clay and steadily raises the wa...
This grid travels with the subject; camera positions stay attached to them.

Camera position 1 Place the camera relative to the subject and choose when it arrives.

above eye level, in front and toward frame-right, at a medium distance

Arrival time 0.0s

Frame left / right 2.4 · frame-right

Front / behind 2.4 · in front

Camera elevation 2.4 · above eye level

+ Add camera position Delete selected

Current camera prompt Updates live from the visual path [Copy camera prompt](#)

Start with a medium high-angle right-front three-quarter view of the ceramic artist. Use a smooth clockwise Arc Shot around the ceramic artist, covering a wide arc at a slow pace. End on a medium high-angle right-rear three-quarter view. If the ceramic artist moves, keep this camera move attached to the subject. Keep the ceramic artist framed throughout.

Two timed camera positions define an arc around the subject; the current camera prompt updates below the planner.

- The green arrow is the subject's front.
- Choose straight or arc geometry.
- Choose whether the grid travels with the subject or remains in scene space.
- Add only meaningful camera positions; two to six are supported.

5. Reconstruct a camera in Targeted Edit

Video Editing Setup
video wizard
Close

Video 1 is the source footage. Answer only the questions that matter for this edit; the Composer will preserve source-owned camera, timing, and unaffected content automatically.

1 What kind of edit are you making?
The available choices are specific to image or video editing.

Edit type

Targeted edit of existing footage

2 Define the requested source-video change
Describe the new viewpoint, framing, or camera movement; the source timing, recorded action, performance, and environment stay authoritative.

What visible element should change? — optional when only changing the camera

the performer's jacket

Requested visible change — optional when only changing the camera

Replace only the jacket with a fitted dark-brown leather jacket.

☒ **Yes — reconstruct the camera viewpoint or movement**
Video 1 supplies the recorded performance and timing; your Camera instruction replaces the source camera.

How do you want to create the camera instruction?

Start with guided controls, then open the Visual Planner

Only the selected method is used in the prompt. The Composer will not combine a custom path with different dropdown settings.

Subject already in Video 1

the performer walking along the beach

Camera orientation / background — optional

The camera is on the ocean side and points inland toward the dunes and distant buildings.

Use this only when the new angle should face a particular part of the location or show a particular background.

Target framing

Wide / full shot

Camera relationship to the subject

On subject's right — show right profile

Cancel Create editing setup

Targeted Edit can change a visible element, reconstruct the camera, or do both.

- Video 1 keeps the performance and timing.
- Choose Guided controls, Visual Planner, or one custom camera sentence.
- Add one orientation/background cue only when it resolves the new view.
- The Composer keeps the other camera drafts dormant.

6. Capture continuity references locally

The Frame Grabber keeps video local and names the PNG by Picture slot, Generation, purpose, and time.

- Step precisely to the source frame.
- Select continuity, Environment, storyboard, composite, keyframe, or scale purpose.
- Capture at decoded native resolution.
- Crop or edit away stale visual evidence before using the frame as continuity guidance.

7. Use AI Setup for first-pass project structure

Copy new-project, full-project, or next-Generation context; paste or open returned schema-v4 JSON for validation.

- AI Setup is an interchange workflow, not an online service inside the app.
- Use `append_generations` to preserve earlier Generations.
- Review imported Picture routing before generation.
- Names and upload order never imply a physical slot unless you explicitly assign it.

8. Build a one-frame image prompt

Image mode assigns reusable references to one still-image edit or composite.

- Choose a preset.
- Assign one role to each reference.
- State the requested change.
- Protect everything that must remain source-authentic.
- Review the image prompt independently of the video grammar.

9. Read Check before Suggestions

A passing Check can still include informational notes such as frame-grid normalization.

Signal	Response
Error	Fix before generation.
Warning	Review the relationship or timing; keep only when intentional.
Info	Understand normalized or inherited state.
Suggestion	Apply only when the coaching fits your intent.

10. Copy, save, and recover

- Copy prompt sends the active Generation to the clipboard.
- Copy all generations creates a labeled multi-Generation sequence.
- Save .json preserves the editable project; supported Chromium browsers offer Save As.
- Open restores a saved JSON project.
- Restore previous returns to the safety backup created before destructive project changes.
- Auto-save remains local to the browser.

Final preflight

Confirm the active mode, duration, physical input map, Shot cut times, reference jobs, speaker IDs, soundscape, music state, and a clean Prompt Check before generation.

V5.36.1 audit summary

- All governed prompt structures match the supplied guides.
- All six built-in examples pass Prompt Check with zero errors.
- No runtime, console, network, or responsive-overflow failures were found.

For field-by-field explanations, use the Full User Guide included with this release. H3 Prompt Composer is an independent community tool.
